Linear regression model

It is a statistical tool used to explain and predict the relationship between 2 variables (simple) or more than 2 (multiple)

Simple linear regression

It aims to fit a line that represents the relationship between: Independent value (x)
Dependent value (y)

Activity 1: Identify independent and dependent data between data

```
data("mtcars")
milespergallon <- mtcars$mpg
cylinders <- mtcars$cyl

linear_model <- lm(cyl~mpg, data=mtcars)

#Dispersion Graphic
plot(milespergallon, cylinders,
main="Miles per gallon vs number of cylinders",
xlab="Miles per gallon",
ylab="Number of cylinders",
pch=19, col="#ccaabb")
abline(linear_model, col="#775566", lwd=2)
```

Miles per gallon vs number of cylinders
